Customer Support chatbot - RAG(Chroma) + Agno Agent/Team

Customer Support chatbot system is a **real-world customer support chatbot** built using **Retrieval-Augmented Generation (RAG)** with **Lang Chain**, and a **multi-agent architecture** using **Agno**. It is designed to handle practical support flows such as **FAQs, order tracking, refunds, shipping issues, and escalation.**

Core Architecture

1. **Data & Retrieval (RAG Layer) :**

- Knowledge sources include **FAQs, policies, return and shipping rules**
- Documents are **chunked, embedded, and stored** in a **vector database**
- On each user query, the retriever fetches the **most relevant context** to ground responses in facts

Technology Stack:

- Vector Database: Used **Chroma DB**
- Embeddings: Used **OpenAI (text-embedding-3-small)** or Hugging Face(**sentence-transformers/all-MiniLM-L6-v2**)
- Retrieval: Used Similarity search with optional reranking

2. **Multi-Agent Support Team (Agno):**

The chatbot behaves like a small support team, with specialized agents:

- **Support Triage Agent –** Identifies user intent (refund, order status, damaged product, payment issue, etc.)
- **RAG Answer Agent –** Uses retrieved knowledge to generate accurate, helpful responses
- **Order / Account Tool Agent (optional) –** Calls **backend Fast APIs** for live data like order status or refund progress
- **Escalation Agent –** Creates a support ticket when confidence is low or human help is required. **Currently showing dummy message to the user but in real chatbot we can integrate Service now API for ticket creation.**

Technology Stack:

- Multi-Agent (Agno)
- Agno Agents & Teams
- Tools:
  - Lang Chain retriever tool
  - Backend API tools (order lookup, refunds)
- Ticket creation tool like Service Now

Chatbot UI :– Used Python Streamlit UI
